

AVALANCHE × TEAM1 HACKATHON — BANGKOK 2026

SafeHold

Know before you hold.

Real-time unlock risk, in plain English.

DATA TRACK

CONSUMER APP TRACK

THE PROBLEM

Retail holders get blindsided by unlocks they never saw coming

Scattered

Vesting schedules live in blog posts, PDFs and Discord announcements, not one trusted place.

Jargon-heavy

Circulating supply, FDV, cliff dates — none of it tells a normal holder what to actually do.

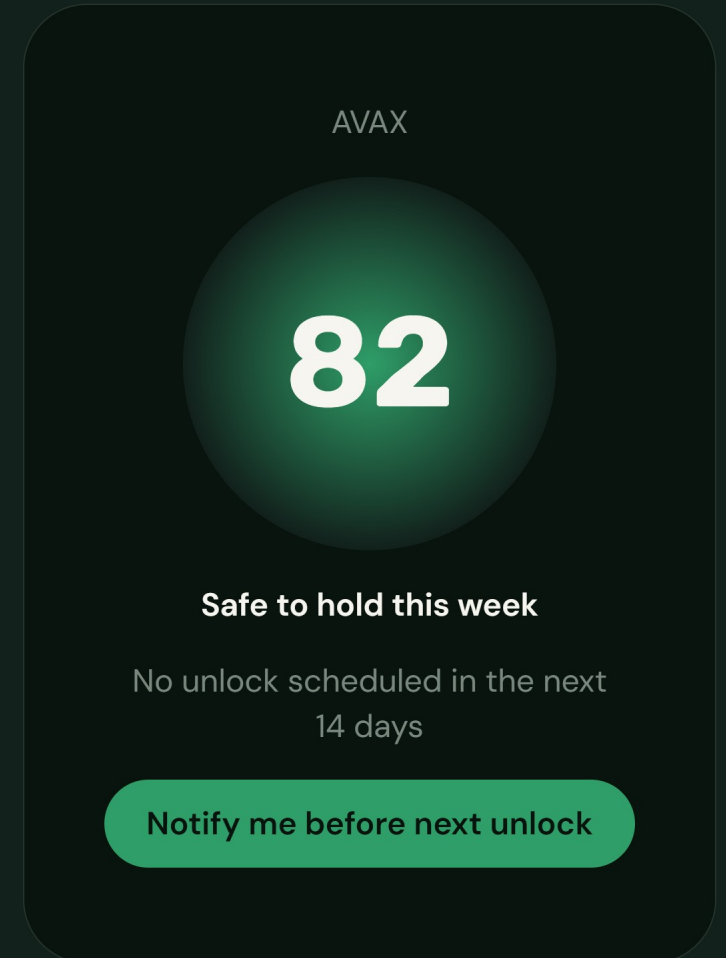

Too late

By the time an unlock is news, price and liquidity have often already moved.

THE SOLUTION

One score. One sentence. One action.

SafeHold turns unlock schedules and on-chain activity into a single hold-safety score anyone can read in three seconds — then lets you set a reminder or an alert with one tap.

HOW IT WORKS

From raw data to a one-tap decision

01

Pull the data

Unlock schedules, supply dynamics and on-chain activity, sourced from Tokenomist.

02

Score it

An AI layer turns the raw numbers into a 0–100 safety score and one plain-language sentence.

03

Act on it

One tap sets a Telegram alert — or, with a spending cap, an on-chain move to a stable asset.

LIVE DEMO · STEP 1

Search any token

No portfolio connection required to start — search a ticker and SafeHold pulls up its cached unlock and supply profile instantly.

Search

Search a token...

AVAX

JOE

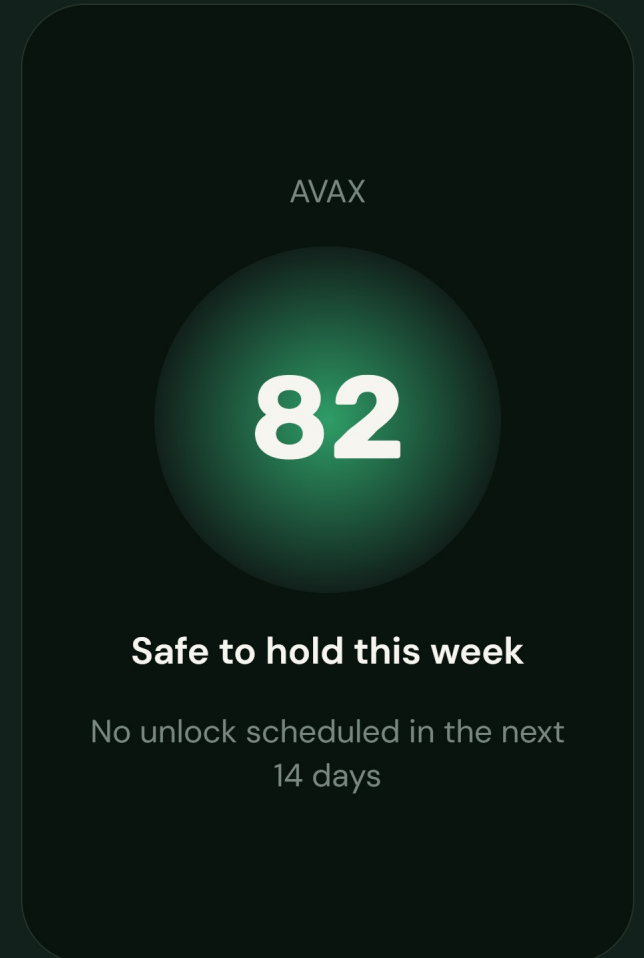

BENQI

PNG

LIVE DEMO · STEP 2

A score you read in three seconds

No unlock in sight — AVAX comes back at 82: safe to hold, plain and simple.

LIVE DEMO · STEP 2B

...or an early warning

A different token, close to a large supply unlock, scores 41 — and says exactly why.

LIVE DEMO · STEP 3

Set it and forget it

One tap sets a personal Telegram alert for that token's next unlock — no need to check back manually.

Alert set on Telegram

We'll message you before this
token's next unlock

Done

Fast enough to act the moment risk changes

Sub-second finality

An alert-to-action flow only works if the chain confirms fast enough to matter.

Low, predictable fees

Small, frequent safety actions need fees that don't eat the position they're protecting.

C-Chain today, an L1 tomorrow

We ship on C-Chain now; a dedicated subnet is the obvious next step as usage grows.

BUILT WITH

Tokenomist.ai

Unlock schedules

The vesting cliffs and linear unlocks behind the score.

Supply dynamics

Circulating vs. fully diluted supply, tracked over time.

On-chain activity

Wallet and volume signals that sharpen the safety score.

BUSINESS MODEL

Free to start, one simple tier to sustain it

FREE

\$0

- Top 20–30 curated tokens
- Safety score refreshed daily
- Shared Telegram alert channel

PRO

\$4.99 /mo

- Full watchlist or wallet import
- Personal push & Telegram alerts
- Faster refresh, historical unlock impact

Later: a B2B data feed for wallets and DAO treasuries, plus clearly-labeled featured protocol slots — the score itself is never for sale.

UNIT ECONOMICS

Cost is fixed. Revenue isn't.

\$69

Tokenomist data plan, per month

~30

Tokens covered on a daily cache refresh

~15

Pro subscribers to cover the data bill

We cache each token once and serve it to every user, so the data bill is set by how many tokens we track — not by how many people use the app. Every subscriber past breakeven is margin.

WHO IT'S FOR

Three groups, one recurring need

Everyday holders

People holding a handful of tokens who have no time to track vesting calendars.

DeFi power users

Users with leveraged or collateralized positions where an unlock changes their risk.

DAO & community treasuries

Treasury managers who need an early warning before a partner token unlocks.

WHAT'S NEXT

Today's demo is the smallest useful version

N
o
w

One token, one safety score,
Telegram alerts.

Next 90
days

Full portfolio scoring, wallet import,
historical unlock impact data.

Lat
er

Automated on-chain hedging with
a user-set spending cap, multi-
chain coverage.
